### **Environmental Management System Scope**

The Environmental Management System (EMS) applies to all activities, processes, and services conducted by KDG Logistics that may interact with the environment.

The scope includes fleet operations and vehicle movements, refueling and fuel storage, diesel consumption, vehicle idling, loading and off-loading activities, vehicle washing, maintenance and use of compressors, generators, air-conditioning systems, and fire-fighting equipment.

It further includes the management of general and hazardous waste, cleaning chemicals, water consumption, ablution facilities, electricity usage, vegetation control, and administrative activities that influence environmental performance.

The EMS covers operations conducted at company premises, yards, workshops, and all transport activities conducted on public roads, including environmental impacts arising from normal, abnormal, and emergency operating conditions.

The EMS is supported by the Environmental Aspects and Impacts Register (ESD 002 A) and the Environmental Management Plan and is implemented in compliance with applicable environmental legislation, including the National Environmental Management Act and associated regulations.
